

cont. Complex Analysis

① Hadamard three-line lemma

② phragmén-Lindelöf principle

ord(f) < 2, cannot be "=" in general
e.g. e^{z^2} Cor If $\text{ord}(f) < 1$, bounded in a line, then $f = \text{constant}$ pf: ~ bounded in both sides of this line, then by Liouville thm. \blacksquare

Thm 11: f entire of exponential type i.e. $|f(z)| \leq A \cdot e^{B|z|}$, then $\sup_{x \in \mathbb{R}} |f(x)| \leq M \Rightarrow |f(x+iy)| \leq e^{By} \cdot M$.

for $\forall y \in \mathbb{R}, x \in \mathbb{R}$

proof: Assume $y > 0$, let $g(z) \stackrel{\text{def}}{=} e^{i(B+\varepsilon)z} f(z)$, then $|g(x)| = |f(x)| \leq M$. and $|g(iy)| = |e^{-c(B+\varepsilon)y} \cdot f(y)|$

$$\leq e^{-cy} \rightarrow 0, \text{ as } y \rightarrow +\infty$$

so $N \stackrel{\text{def}}{=} \sup_{y>0} |g(iy)|$ can be obtained. Apply thm 10. to , then we have

$$\sup_{Im(z)>0} |g(z)| \leq \max\{M, N\}.$$

Notice that N cannot be larger than M . so $\sup_{Im(z)>0} |g(z)| \leq M$

$$\Rightarrow |f(x+iy)| \leq e^{By} \cdot |g(x)| \leq M \cdot e^{By}. \quad \blacksquare$$

Remark:

① By thm 11, $BV \stackrel{\text{def}}{=} \{f \text{ entire of exponential type } \tau\}$, is a Banach space under $\|f\| \stackrel{\text{def}}{=} \sup_{x \in \mathbb{R}} |f(x)|$ Bernstein's inequality: $\forall f \in BV, \|f'\| \leq \tau \|f\|$, and " $=$ " holds if and only if $f = d \cdot e^{iz^2} + p \cdot e^{-iz^2}$.

$$d, p \in \mathbb{C}$$

Exercise 12.13, not strictly required. (not in exam)

Thm 12: If f is entire of exponential type. and $\lim_{|x| \rightarrow \infty} |f(x)| = 0$, then $\lim_{|x| \rightarrow \infty} |f(x+iy)| = 0$, uniform in y

in every bounded set.

proof: Recall Montel's thm (thm 3.3, chapter 8, Stein)

not given in textbook Suppose. $\mathcal{F} = \{f_\alpha\}_\alpha$ is a family of holomorphic functions on \mathbb{D} , that is uniformlybounded in every compact subset of \mathbb{D} , thenc) \mathcal{F} is equi-continuous in every cpt subset of \mathbb{D}

$$\forall \varepsilon > 0, \exists \delta > 0, \text{s.t. } |f_\alpha(z_1) - f_\alpha(z_2)| < \varepsilon, \forall z_1, z_2 \in \mathbb{D}, |z_1 - z_2| < \delta$$

c) \mathcal{F} is a normal family (the sequence in \mathcal{F} , \exists subsequence s.t. uniformly convergent in every compact subset)

Now, to prove thm 12, consider $\mathcal{F} = \{f(z-t) : t \in \mathbb{R}\}$ (may say $0 < \operatorname{Im} z \leq 1$), with

$\mathcal{D} = (-\varepsilon, 1+\varepsilon) \times (-\varepsilon, 1+\varepsilon) \supseteq [0, 1]^2$, now by montel's thm

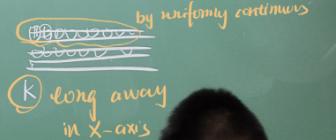

① f is uniformly continuous in $\{0 < \operatorname{Im} z \leq 1\}$

② $\lim_{x \rightarrow 1} f(x+iy) = 0, \forall y \in (0, 1)$

To prove 12, consider $\mathcal{F} = \{f(z-t) : t \in \mathbb{R}\}$ (^{may say $0 < \operatorname{Im} z \leq 1$})
 with $\mathcal{D} = (-\varepsilon, 1+\varepsilon) \times (-\varepsilon, 1+\varepsilon)$, By Montel's Thm.

① f is uniformly continuous in $\{0 < \operatorname{Im} z \leq 1\}$.

② $\lim_{y \rightarrow 0} f(x+iy) = 0, \forall x \in (0, 1)$

Then 

Exercise 2.3.4

mainly about proof of the 3-line lemma

Introduce a concept: Exponential type 0: $\forall \theta > 0, \exists A > 0$ s.t. $|f(z)| \leq Ae^{k|z|}$.

Final remark: f is exponential type, \Rightarrow f has no zeros on $\operatorname{Im} z = 0$.

Section 2: Carleman's Formula

and no zero in $\partial \mathcal{D}$

Thm B: Let f be analytic in $\{\operatorname{Im} z \geq 0\}$, $Z_k = r_k e^{i\theta_k}, k=1, 2, \dots, n$ be its zeros in

 Similar thing like In Jensen's formula, we integrate on entire disk, hence Jensen's formula lacks information on X -axis, in thm B, semi-disk \Rightarrow Information on X -axis

$$\text{then } \sum_{k=1}^n \left(\frac{1}{r_k} - \frac{1}{R} \right) \cdot \sin \theta_k = \frac{1}{2\pi R} \int_0^\pi \log |f(re^{i\theta})| \sin \theta d\theta$$

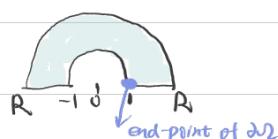

$$+ \frac{1}{2\pi R} \int_1^R \left(\frac{1}{x^2} - \frac{1}{R^2} \right) \log |f(x) - f(R)| + O_R(1).$$

comprehension or usage of complex analysis
proof: Recall that $\log |f(z)| = \operatorname{Re}(\log f(z))$ (property of \log)

Recall $\log |f(z)| = \operatorname{Re}(\log f(z))$

$\log f(z) = \int_{\partial D} \frac{f'}{f} dz$

to prove thm B, consider $I \stackrel{\text{def}}{=} \frac{1}{2\pi i} \int_{\partial D} \left(\frac{1}{R^2} - \frac{1}{z^2} \right) \log f(z) dz$

$$\begin{aligned} I &\stackrel{\text{def}}{=} \frac{1}{2\pi i} \int_{\partial D} \left(\frac{1}{R^2} - \frac{1}{z^2} \right) \log f(z) dz \\ &= \frac{1}{2\pi i} \left[\int_{-R}^R \left(\frac{1}{R^2} - \frac{1}{x^2} \right) \log f(x) dx + \int_R^R \left(\frac{1}{R^2} - \frac{1}{x^2} \right) \log f(x) dx \right] \\ &= \frac{1}{2\pi i} \int_0^\pi \left(\frac{1}{R^2} - \frac{1}{R^2 e^{2i\theta}} \right) \log f(re^{i\theta}) dr + O_R(1) \end{aligned}$$

$$\text{So } \int_{-R}^R + \int_R^R = \frac{1}{2\pi i} \int_0^\pi \left(\frac{1}{R^2} - \frac{1}{R^2 e^{2i\theta}} \right) \log f(x) - f(x) dx = \frac{i}{2\pi} \int_0^\pi \left(\frac{1}{R^2} - \frac{1}{R^2 e^{2i\theta}} \right) \log f(x) - f(x) dx.$$

$$\text{and } \int_{-R}^R = \frac{1}{2\pi i} \left[\int_{\Gamma} \left(\frac{1}{R^2} - \frac{1}{z^2} \right) \log f(z) e^{iz} dz - \int_{\Gamma} \left(\frac{1}{R^2} \log f(z) \right) e^{-iz} dz \right] = \frac{i}{\pi R} \int_0^\pi \log f(R e^{i\theta}) \sin \theta d\theta.$$

The RHS of Carleman can be obtained from $\operatorname{Im}(I)$ imaginary part

and for the LHS, notice that

For the LHS. Notice $\left(\frac{1}{R^2} - \frac{1}{z^2} \right) \log f(z) = \frac{d}{dz} \left(\left(\frac{1}{R^2} + \frac{1}{z^2} \right) \log f(z) \right)$

$$\Rightarrow I = \frac{1}{2\pi i} \int_{\Gamma} \frac{d}{dz} \left(\dots \right) - \underbrace{\frac{1}{2\pi i} \int_{\Gamma} \left(\frac{1}{R^2} + \frac{1}{z^2} \right) \frac{f'}{f} dz}_{\substack{\text{留数} \\ \text{Residue Thm}}} - \left(\frac{1}{R^2} + \frac{1}{z^2} \right) \cdot \frac{f'}{f}$$

$\left(\frac{1}{R^2} + 1 \right) \cdot \# \text{ of zeros} \in \mathbb{N}$

$$\Rightarrow \operatorname{Im} I = - \operatorname{Im} \left(\frac{1}{2\pi i} \int_{\Gamma} \left(\frac{1}{R^2} + \frac{1}{z^2} \right) \frac{f'}{f} dz \right) = \sum_{k=1}^n \left(\frac{1}{r_k} - \frac{1}{R^2} \right) s_{k,R}$$

III

PT. Recall $\log f(z) = \operatorname{Re}(\log f(z))$

Full Proof

$\log f(z)$

$\log f(z) = \int_{\Gamma} \frac{f'}{f} dz$

end point of $\partial\Omega$

$$I := \frac{1}{2\pi i} \int_{\partial\Omega} \left(\frac{1}{R^2} - \frac{1}{z^2} \right) \log f(z) dz$$

$$= \frac{1}{2\pi i} \int_0^\pi \left(\frac{1}{R^2} - \frac{1}{R^2 e^{i\theta}} \right) \log f(R e^{i\theta}) R e^{i\theta} d\theta + \int_R^\infty \left(\frac{1}{x^2} - \frac{1}{R^2} \right) \log f(x) dx + \int_0^R \left(\frac{1}{R^2} - \frac{1}{x^2} \right) \log f(x) dx$$

$$\begin{aligned} \text{So } S_{-R}^{+i} + S_1^R &= \frac{1}{2\pi i} \int_{-R}^R \left(\frac{1}{R^2} - \frac{1}{x^2} \right) \log f(x) f'(x) dx \\ &= \frac{i}{\pi R} \int_{-R}^R \left(\frac{1}{x^2} + \frac{1}{R^2} \right) \log f(x) f'(x) dx \\ &= \frac{1}{2\pi i} \int_{-R}^R \frac{1}{R} \log f(x) \cdot e^{ix} dx \rightarrow \left(\frac{1}{R^2} \log f(z) \right) \cdot e^{-iz} dz \\ &= \frac{i}{\pi R} \int_0^\pi \log f(R e^{i\theta}) s_{k,R} d\theta \end{aligned}$$

The RHS of Carleman can be obtained from $\operatorname{Im}(I)$.

For the LHS. Notice $\left(\frac{1}{R^2} - \frac{1}{z^2} \right) \log f(z) = \frac{d}{dz} \left(\left(\frac{1}{R^2} + \frac{1}{z^2} \right) \log f(z) \right)$

$$\Rightarrow I = \frac{1}{2\pi i} \int_{\Gamma} \frac{d}{dz} \left(\dots \right) - \underbrace{\frac{1}{2\pi i} \int_{\Gamma} \left(\frac{1}{R^2} + \frac{1}{z^2} \right) \frac{f'}{f} dz}_{\substack{\text{留数} \\ \text{Residue Thm}}} - \left(\frac{1}{R^2} + 1 \right) \cdot \# \text{ of zeros} \in \mathbb{N}$$

$$\Rightarrow \operatorname{Im} I = - \operatorname{Im} \left(\frac{1}{2\pi i} \int_{\Gamma} \left(\frac{1}{R^2} + \frac{1}{z^2} \right) \frac{f'}{f} dz \right) = \sum_{k=1}^n \left(\frac{1}{r_k} - \frac{1}{R^2} \right) s_{k,R}$$

Now, we see a corollary of Carleman

Cor (Thm 14): f entire of exponential type, bounded along the real axis, then $\sum_{k=1}^n \frac{s_{k,R}}{r_k}$ is absolutely convergent.

Proof: We may assume f has no zero in the real axis (by continuity argument). then consider upper/lower half-plane

might need elaboration

separately, say $\theta_k > 0$, now, by exponential type,

$\log |f(z)| \leq C|z| = CR$, so the RHS of Carleman is

$$\leq \frac{1}{\pi R} \int_0^\pi C R \sin \theta d\theta + \frac{1}{2\pi} \int_1^R \left(\frac{1}{x^2} - \frac{1}{R^2} \right) \cdot C R dx + O(R)$$

$\leq M < \infty$. uniformly in \mathbb{R}

which means $LHS = \sum_{k=1}^n \left(\frac{1}{r_k} - \frac{1}{R^2} \right) s_{k,R} < M < \infty$, $\forall R$

$$\sum_{k=1}^n \left(1 - \frac{r_k^2}{R^2} \right) \frac{s_{k,R}}{r_k} \cdot \chi_{k \in n} \xrightarrow{R \rightarrow \infty} \sum_{k=1}^n \frac{s_{k,R}}{r_k}$$

III

We now may go back to basis

Cor of thm 14: Thm 15: If $\{\lambda_n\} \in \mathbb{C}$, $|\arg(\lambda_n - \frac{\pi i}{2})| \leq L < \frac{\pi}{2}$, and $\sum \frac{1}{|\lambda_n|} = \infty$, then $\{e^{i\lambda_n t}\}$ is complete in $C[a,b]$

$$-\infty < a < b < \infty$$

Proof: If not, $\exists \mu \in C([a,b])^*$ s.t. $f(z) = \int_a^b e^{-iz\lambda_n} dt$ has zeros $\{\lambda_n\}$
 $\Rightarrow \sum \frac{|\sin \theta_k|}{r_k} < \infty$ entire function of exponential type

As $|\arg(\lambda_n - \frac{\pi i}{2})| \leq L < \frac{\pi}{2}$, $|\lambda_n k| \approx_L |\operatorname{Im}(\lambda_n k)|$, or $|\sin \theta_k| \approx_L 1$.

$$\Rightarrow \sum \frac{1}{r_k} < \infty, \text{ contradiction. } \blacksquare$$

Cor of thm 15: $0 < \lambda_1 < \lambda_2 < \dots$ in \mathbb{R} , s.t. $\sum \frac{1}{\lambda_n} = \infty$, then $\{t^{\lambda_n}\}$ is complete in $C[a,b]$, $0 < a < b < \infty$

Proof: consider $\{i\lambda_n\}$, so by thm 15 $\{e^{-ty\lambda_n}\}$ is complete $\Rightarrow \{t^{\lambda_n}\}$ is complete. \blacksquare

Section 2.2.3 Integrability on a line.

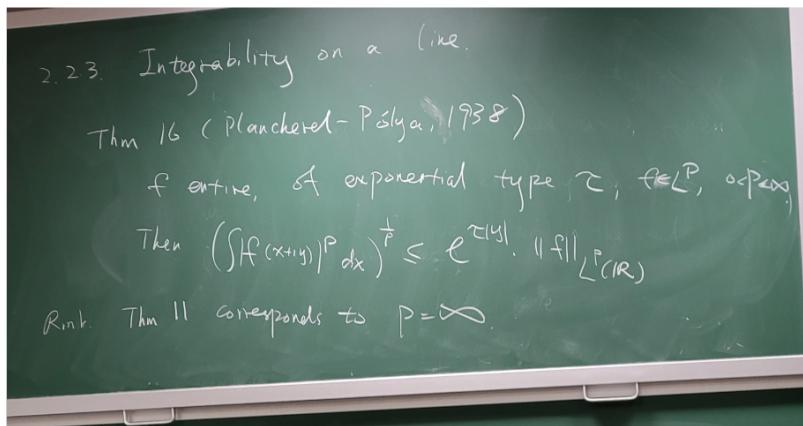

Thm 16 (Plancherel-Polya, 1938)

(later we will see L^2)

f entire, of exponential type T , $f \in L^p$, $0 < p \leq \infty$, then $(\int |f(x+iy)|^p dx)^{\frac{1}{p}} \leq e^{T|y|} \cdot \|f\|_{L^p(\mathbb{R})}$

Rmk: thm 11 corresponds to $p=\infty$

-the proof is essentially the same with that of thm 11

The proof is essentially the same with that of
 Thm 11. The key is, $g(z) := \int_a^z |f(z-t)|^p dt$
 is subharmonic, on which the max. principle holds.

L^2 的结果要好看很多：
